ABOUT

Mike

Principal Consultant - Red Siege
> 20 years IT > 12 years security
kayaking / fishing / music /
photography

Pen Testing is **BROKEN**

- Internal pen tests don't represent how attackers operate
 - Starting inside the network (kali or otherwise)
 - Noisy scans
 - Lobbing exploits everywhere

"I WANT A RED TEAM"

- Most customers don't need a true red team
 - Require a lot of time = expensive
 - Requires maturity in IT org.
 - Low return on investment compared to other test options

ASSUMED WHAT?

- Based on assumption endpoint is already compromised / org is breached
 - What can an attacker do with this access

AB - TWO(ish) MODELS

- Malicious User
- Compromised User
- Both use standard workstation image with representative users
 - Preferably a recently terminated user
- DA is a tool, not a destination!

Compromised USER - PATH A

- Simulate a user who clicked on a payload
- Execute a custom payload
- All ops take place over C2 framework
 - Pivot to remote access with creds

Compromised USER - PATH B

- Demonstrate impact of compromised user
- Operate on workstation
 - Shipped laptop / VPN + RDP / on site
- Work with tools available on desktop or what can be loaded
 - Initiate C2 if needed

AV/EDR - DISABLED?

- AV/EDR can be bypassed given time
- Is it worth client \$\$\$ to spend time to bypass?
- Discuss goals with client
- @HackingLZ - Start with AV/EDR enabled, verify bypass or visibility of actions, then disable if needed

MALICIOUS USER

- Simulates employee who wants to steal / cause harm
- Shipped laptop / VPN + RDP / on site
- Testing starts on standard workstation
 - Whatever tooling is available on workstation
- Standard AV/EDR config

When you put 'password' in the password field and it works.

```
( function (ko, datacontext) ) {  
  <div style="background-image:url('/pix/samples/bgl.gif');  
    background . text- todoitem ;  
    height . text - :200px;">  
  <p>The image can be tiled across the background, while the text  
</div>
```

```
// persisted properties
```

```
<html> <p style="font-weight:bold;">HTML font code is done using  
<html> <body style="background-color:yellowgreen;color:white;">  
<html> <todoitemid = data.todoitemid;
```

```
// Non - persisted properties
```

```
<html> <errorMessage = ko , observable() ;
```

```
<p style="color:orange;">HTML font code is done using CSS </p>
```

```
function todoitem(data) { ;
```

```
var self = this ;
```

```
data = data || {} ;
```

```
<p>You can make <span style="font-style:italic">some</span> the HTML
```

```
<p>You can bold <span style="">parts</span> of your text using the HTML
```

```
<html> <p style="font-weight:bold;"
```

REDSIEGE

REAL WORLD TACTICS

- <https://www.fireeye.com/blog/threat-research/2019/04/finding-weaknesses-before-the-attackers-do.html>
- Blog lays out likely real-world attack scenario
 - Phishing
 - Pivot to internal through remote access
 - Targeted Kerberoasting => elevation of privilege
 - Access high-value targets

ASSUMED BREACH TACTICS

- Simulate payload sent via email / SE
- Search out high value targets / data
 - Kerberoasting => elevation of privilege
 - Gather credentials
 - Pivot to data
 - Access high-value targets
- DA is a tool, not a destination!

DOMAIN FRONTING

- Vendors are breaking traditional fronting model
 - Some CDNs still work
- *.cloudfront.net / *.azureedge.net still works
- Build custom C2 profile
 - <https://github.com/bluescreenofjeff/>
 - Malleable-C2-Randomizer

INITIAL ACCESS

- Simulating phishing
- HTA is still effective
 - <https://github.com/trustedsec/unicorn>
 - <https://github.com/danielbohannon/Invoke-Obfuscation>
 - <https://github.com/samratashok/nishang/blob/master/Client/Out-HTA.ps1>
 - <https://github.com/nccgroup/demiguise>

INITIAL ACCESS

- Macros
- ClickOnce Executables
 - <https://blog.netspi.com/all-you-need-is-one-a-clickonce-love-story/>
- So many more...

FINDING ACCOUNTS

- Password spraying (Internal or External)
 - OWA / O365
 - <https://github.com/dafthack/MailSniper>
- Domain accounts
 - <https://github.com/dafthack/DomainPasswordSpray>

KERBEROASTING

- Traditional tools
 - PowerView
 - Invoke-Kerberoast
- https://raw.githubusercontent.com/fullmetalcache/tools/master/autokerberoast_nomimi_stripped.ps1
- Invoke-AutoKerberoast -Format hashcat

KERBEROASTING

- Ideally low & slow
 - Target users in specific groups (PowerView)
 - <https://www.harmj0y.net/blog/powershell/kerberoasting-without-mimikatz/>
 - Get-DomainUser -SPN & Get-DomainSPNTicket -SPN
- Random Delay
- <https://adsecurity.org/?p=230>

MINING AD

- SharpHound via execute-assembly
 - Research stealth options
 - --NoSaveCache is your friend
- Hunt for creds in AD schema
 - ADExplorer.exe -snapshot "" ad.snap -noconnectprompt
 - <https://www.blackhillsinfosec.com/domain-goodness-learned-love-ad-explorer/>

HUNTING GPP CREDENTIALS

- GPP = XML config files stored in SYSVOL
 - Store credentials for workstation local admin, mapping drives, etc.
 - <https://adsecurity.org/?p=2288>
- PowerSploit Get-GPPPassword
- PowerSploit PowerUp Get-CachedGPPPassword

LATERAL MOVEMENT

- Find lateral movement to admin access with PowerView
 - Test-AdminAccess -ComputerName
 - Get-DomainComputer | Test-AdminAccess
- psexec
- wmic

TRAWLING FILES/SHARES

- Elevated account creds (DA / sa / etc.) frequently found in files
 - PowerShell PSReadLine Logs (ConsoleHost_history.txt)
 - Source code & sensitive data
- PowerView
 - Invoke-ShareFinder -CheckAccess
 - Find-InterestingDomainShareFile
 - Find-InterestingFile

HUNTING SESSIONS

- Find files that can be used for lateral movement
 - SSH private keys, RDP files, FileZilla / WinSCP saved passwords, etc.
- <https://github.com/Arvanaghi/SessionGopher>
 - Invoke-SessionGopher -Thorough (local system)
 - Invoke-SessionGopher -Target hostxyz -Thorough
 - Invoke-SessionGopher -AllDomain -Thorough

BYO POWERSHELL

- Code can be executed in ISE even if PS script execution is disabled
- Build custom PS environment
 - <https://github.com/fullmetalcache/PowerLine>

PROS & CONS

- Pro

- Better understanding of strengths & weaknesses
- Ability to model real-world TTPs

- Cons

- Limited time means we have to be noisier
- Not focused on vulns
- Non-representative accounts/workstations can negatively impact test

SUMMARY

- Better way to prepare clients for attacks they're likely to face
- Requires maturity in client processes
 - VA & pen test cycles before client is ready
- Work with client to get good accounts and workstations
- PowerShell & Cobalt Strike aren't the only way - these were just examples

QUESTIONS?
